

Climate Change Policy

The ERAMET Group has a Sustainable Development policy and an Energy policy that come under a value-creating, environmentally-friendly continuous improvement rationale. The Group is committed to the energy efficiency of its operations and publishes the amount of direct and indirect emissions relating to its activities every year.

The metals and alloys produced by the Group are used to make every kind of energy system, particularly those that use zero or low-carbon energies, and are essential to the implementation of the energy transition.

Under the Paris Agreement of December 2015, world leaders pledged to keep the increase in the world's average temperature under the +2°C threshold compared with pre-industrial levels, stepping up the momentum of the fight against climate change.

The Group recognises the need to reduce its greenhouse gas emissions and adapt to the consequences of climate change. Therefore, it pledges to:

- Contribute, in its main host countries, to the collective effort against climate change.
- Strengthen its energy efficiency process.
- Enhance and develop raw material recycling channels under a circular economy rationale.
- Favour, in economically acceptable conditions, zero or low-carbon energy sources and processes.
- Promote Research & Development projects with the aim of reducing direct or indirect emissions that result from its processes or the use of its products.
- Assess its projects' impact in terms of greenhouse gas emissions.
- Factor climate change into its Risk Management policies for the technological, economic and social aspects, including in terms of adaptation.
- Factor climate change into the parameters of the Group's Strategy.

Implementation of this Climate Change Policy is based on the commitment of the Group's management and employees.
